Attempt : 1

Total Mark : 10

Marks Obtained : 10

Section 1 : Coding

1. Problem Statement

Develop a program using hashing to manage a fruit contest where each fruit is assigned a unique name and a corresponding score. The program should allow the organizer to input the number of fruits and their names with scores.

Then, it should enable them to check if a specific fruit, identified by its name, is part of the contest. If the fruit is registered, the program should display its score; otherwise, it should indicate that it is not included in the contest.

Input Format

The first line consists of an integer N, representing the number of fruits in the contest.

The following N lines contain a string K and an integer V, separated by a space, representing the name and score of each fruit in the contest.

The last line consists of a string T, representing the name of the fruit to search for.

Output Format

If T exists in the dictionary, print "Key "T" exists in the dictionary.".

If T does not exist in the dictionary, print "Key "T" does not exist in the dictionary.".

Refer to the sample outputs for the formatting specifications.

Sample Test Case

Input: 2
banana 2
apple 1
Banana

Output: Key "Banana" does not exist in the dictionary.

Answer

```
# You are using Python
def manage_fruit_contest(n, fruit_data, search_fruit):
    fruit_dict = {} # Dictionary to store fruit names and scores

    # Insert fruits into the dictionary
    for name, score in fruit_data:
        fruit_dict[name] = int(score)

    if search_fruit in fruit_dict:
        print(f'Key "{search_fruit}" exists in the dictionary.')
    else:
        print(f'Key "{search_fruit}" does not exist in the dictionary.')

# Read input values
N = int(input().strip())
fruit_data = [input().split() for _ in range(N)]
```

```
search_fruit = input().strip()
```

```
# Process and display results
```

```
manage_fruit_contest(N, fruit_data, search_fruit)
```

Status : Correct

Marks : 10/10
